

# You need faster answers. Genomic profiling can help.

## Why Did My Doctor Order This Test?

The Oncomap™ test is a genomic test that can help guide timely treatment options by providing personalized insights from an analysis of your tumor. Your cancer tissue is analyzed to identify changes or mutations in the structure of your tumor's genes. This information can help your doctor identify available targeted treatments and immunotherapies that are most appropriate to treat your cancer. The test identifies clinical trials associated with your type of cancer and can provide valuable data and analysis to inform treatment decisions where no standard of care exists.

The test can identify treatment options from:

- 100+ therapies
- 45+ combination therapies
- 650+ clinical trials

### Genomic Profiling – The Key to Knowing Your Cancer

Cancer treatment is not a one-size-fits-all solution, because everyone's cancer is unique. Precision medicine provides your doctor with information on which available treatments, immunotherapies, or clinical trials could work best for you, based on the genomic profile of your tumor. Genomic profiling is used to examine the gene mutations (or biomarkers) in your tumor, providing critical information on which treatment options are most appropriate for your cancer. Precision medicine is personalized and targeted for your individual cancer.

Ian A. and his wife, Janice  
Oncomap™ patient navigating advanced Esophagogastric Cancer since 2021.

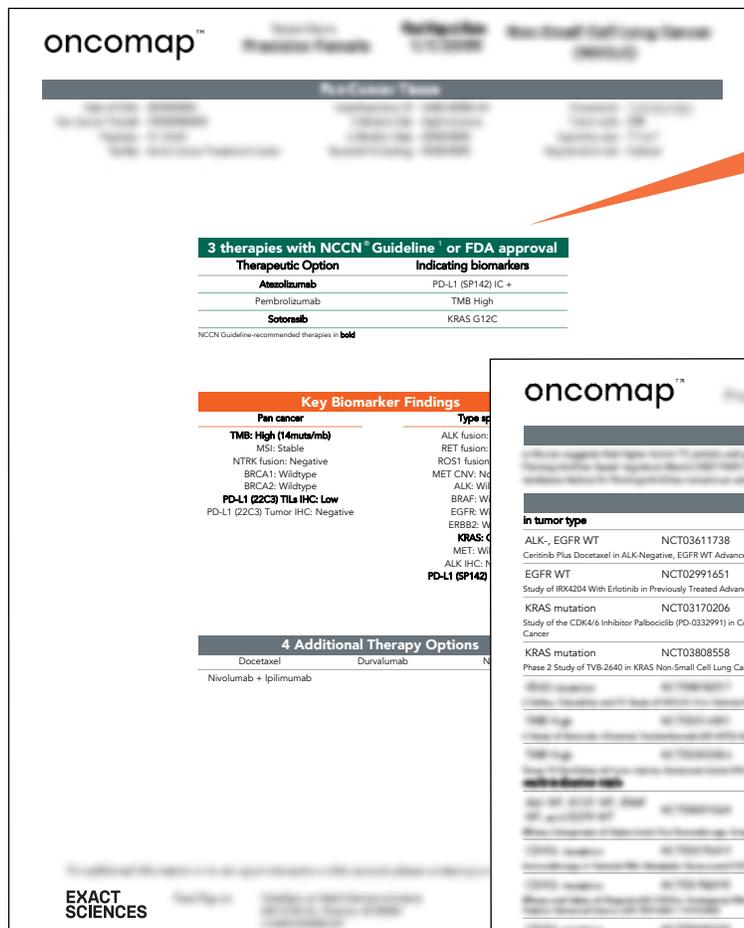

## How Does it Work?

	1. The tissue from your tumor that has already been biopsied or removed is sent to our lab for analysis. No additional procedures are required. The test is used to create a profile of your unique cancer.
	2. Test results are sent to your doctor in the form of a report.
	3. You and your doctor review the results together to determine your personalized treatment options.

## What Can I Expect from My Test Results?

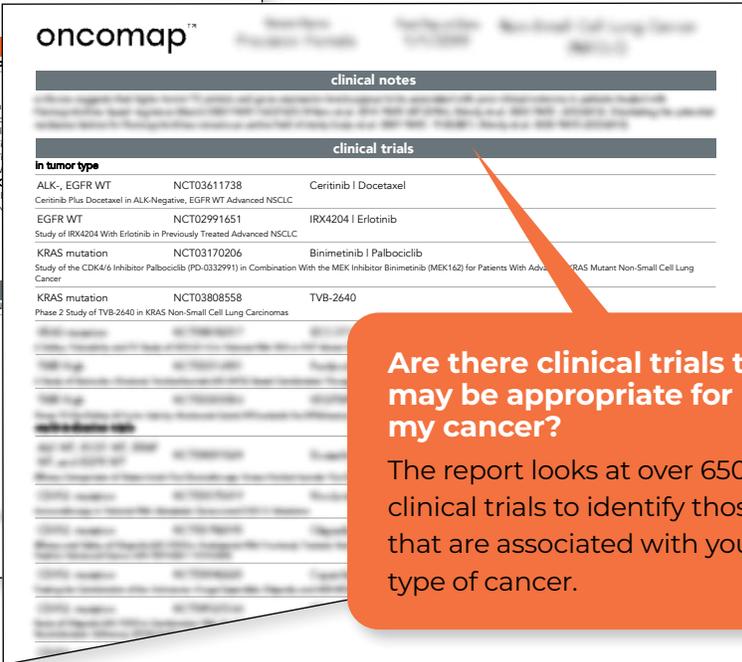

Once the tumor sample is sent to the laboratory, the cancer's DNA is analyzed, and the Oncomap test is used to create a profile of your cancer's unique makeup.

The report identifies therapeutic options and available clinical trials based on biomarkers identified from the genomic profiling of your cancer's tumor and can help answer questions such as:

**Which therapeutic options exist for the identified biomarkers in my genomic profile?**

The report will identify available treatments and immunotherapies that will target your cancer.

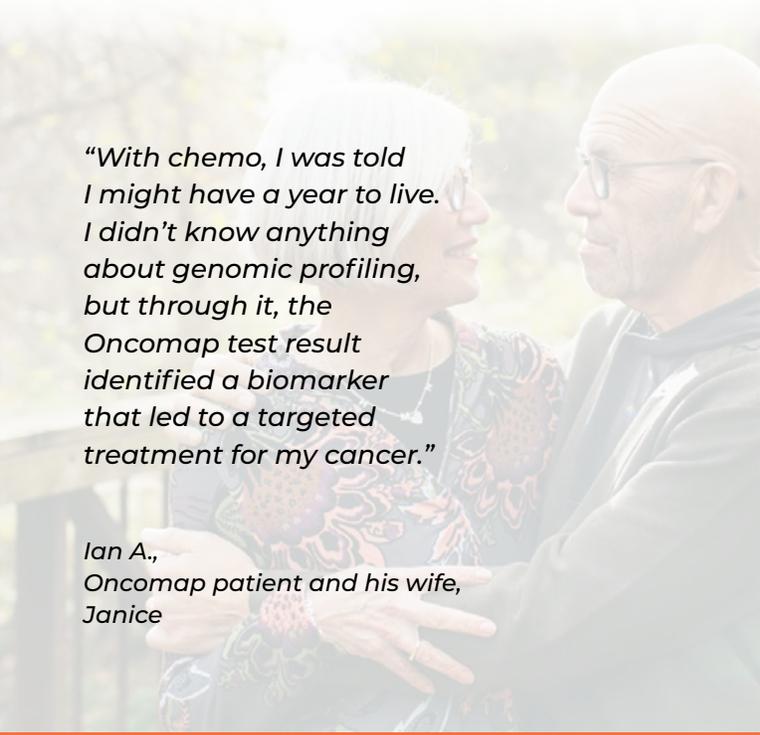

**Are there clinical trials that may be appropriate for my cancer?**

The report looks at over 650 clinical trials to identify those that are associated with your type of cancer.

With the Oncomap test, your doctor can tailor treatment strategies based on your tumor's gene mutation matches. The Oncomap test is precision medicine working for you.

**At your next appointment, talk to your doctor about your Oncomap test results — because you deserve to have a treatment that's specific to your cancer.**

*“With chemo, I was told I might have a year to live. I didn’t know anything about genomic profiling, but through it, the Oncomap test result identified a biomarker that led to a targeted treatment for my cancer.”*

*Ian A.,  
Oncomap patient and his wife,  
Janice*
